Casparplay is an open-source project to automate TV station broadcast by integrating Razuna open-source digital asset management with CasparCG open-source TV playout server and character generator. The integration is done by a PHP scheduler which creates a playlist of program/ad video clips from Razuna digital asset IDs and then copying those assets to CasparCG playout folder.

Casparplay can be completely integrated with Sysnova open-source ERP to provide automated invoicing and billing to advertising clients.
